Dog Breed Identification Using Transfer Learning

---

1. INTRODUCTION

1.1 Project Overview

Dog Breed Identification using Deep Learning is an image classification system designed to automatically recognize and identify different dog breeds from images. With the rapid advancement of computer vision and artificial intelligence, deep learning techniques—especially Convolutional Neural Networks (CNNs)—have shown exceptional performance in image recognition tasks.

This project utilizes a trained CNN model to analyze visual features such as shape, color, texture, and facial patterns of dogs. Users can upload an image of a dog through a web-based interface, and the system predicts the corresponding dog breed in real time. The application is developed using Flask for the backend and HTML, CSS, and JavaScript for the frontend, making it user-friendly and efficient.

The primary objective of this project is to provide an accurate, automated, and fast solution for dog breed identification, which can be useful in veterinary care, animal shelters, pet adoption platforms, and educational purposes.

1.2 Purpose

The purpose of this project is to design and implement a deep learning–based system capable of accurately identifying dog breeds from images. This system aims to achieve the following objectives:

- **Automated Breed Identification:** Eliminate the need for manual breed recognition by providing an intelligent image-based solution
- **Accuracy Improvement:** Utilize Convolutional Neural Networks to achieve high accuracy in breed classification
- **User-Friendly Interface:** Provide a simple web application that allows users to upload images and receive instant predictions
- **Real-Time Prediction:** Enable fast and efficient breed prediction through a deployed deep learning model
- **Practical Applications:** Assist veterinarians, pet owners, animal shelters, and adoption centers in identifying dog breeds

2. IDEATION PHASE

2.1 Problem Statement

Dog breed identification is an important task in veterinary science, animal welfare, and pet adoption systems. However, manual identification of dog breeds is often challenging due to:

- Similar physical characteristics among different dog breeds
- Variations in dog appearance due to age, posture, lighting, and background
- Lack of expert knowledge among general users
- Time-consuming and error-prone manual classification

Challenge: How can we accurately identify a dog's breed from an image using deep learning techniques in real time while ensuring high accuracy, reliability, and ease of use?

2.2 Empathy Map Canvas

Canvas Element	Description
USER	Pet Owner / Veterinarian / Animal Shelter Staff
THINKS	"What breed is this dog? Is there an easy way to identify it accurately?"
FEELS	Curious but unsure, concerned about making incorrect assumptions
SAYS	"I need a quick and reliable way to identify dog breeds."
DOES	Uploads dog images, searches online, consults experts
PAIN POINTS	Manual errors, lack of expertise, time-consuming identification
GAINS	Accurate breed identification, time saving, better decision-making

2.3 Brainstorming

Ideas Generated:

- Use image datasets of various dog breeds for trainingApply Convolutional
- Neural Networks (CNN) for image classification
- Build a web-based application for easy user interaction
- Allow users to upload dog images and receive instant predictions
- Display predicted breed along with uploaded image
- Improve accuracy through image preprocessing techniques
- Extend system for mobile or cloud-based deployment

Selected Approach: Develop a Convolutional Neural Network (CNN)–based image classification model trained on a labeled dog breed dataset. The trained model is deployed using a Flask web application, allowing users to upload dog images and receive real-time breed predictions through an intuitive web interface.

3.REQUIREMENT ANALYSIS

3.1 Customer Journey Map

Stage	User Action	Touchpoints	Pain Points	Emotion
Awareness	Notices difficulty in identifying dog breeds	Online images, pets, shelters	Lack of expertise, confusion	Curious
Consideration	Searches for automated breed identification	Websites, AI tools	Inaccurate or complex solutions	Hopeful
Decision	Chooses to use the Dog Breed Identification system	Web application	Trust in prediction accuracy	Confident
Implementation	Uploads dog image to the system	Upload form, browser	Image quality issues	Slightly Anxious
Usage	Receives predicted bree	Prediction result page	Understanding prediction confidence	Satisfied
Evaluation	Uses results for decisions (vet, adoption)	Output report	Need for accuracy	Confident

3.2 Solution Requirements

Functional Requirements:

- Accept dog images as input from users
- Preprocess uploaded images (resize, normalize)
- Predict dog breed using a trained CNN model
- Display predicted breed along with uploaded image
- Support real-time image prediction
- Load and use a saved trained deep learning model

Non-Functional Requirements:

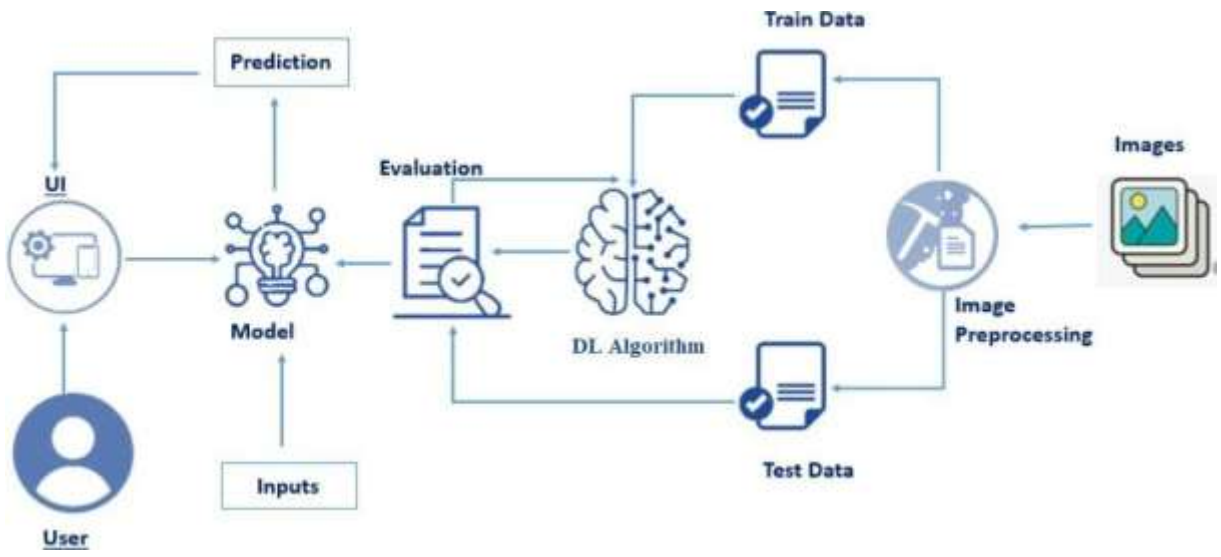
- Web-based interface accessible via any browser
- Fast prediction response time (less than 3 seconds)
- User-friendly and intuitive interface
- Scalable for cloud deployment
- Secure handling of uploaded images
- Efficient processing of multiple requests

3.3 Data Flow Diagram

The system operates at two levels.

At **Level 0 (Context Diagram)**, the **User** uploads a dog image to the **System**, which processes the image and returns the **Predicted Dog Breed** as output.

At **Level 1 (Detailed Data Flow Diagram)**, the **User Input (Image)** is sent to the **Flask Server**, where the image is preprocessed and normalized. The processed image is then passed to the **CNN Model (dogbreed.h5)** for prediction. The prediction result is rendered using **HTML Templates** and displayed back to the user through the web interface.



3.4Technology Stack

Component	Technology	Purpose
Programming Language	Python 3.9	Core application development
Data Processing	Pandas, NumPy , OpenCV	Image preprocessing
Deep Learning	TensorFlow, Keras	CNN model building
Machine Learning model	Convolutional Neural Network (CNN)	Dog breed classification
Web Framework	Flask	Backend web application
Model Persistence	vv	Save/load model

Frontend	HTML, CSS, JavaScript	User interface
Development Env.	VS Code, Jupyter Notebook	Model training & app development

4. PROJECT DESIGN

4.1 Problem Solution Fit

Problem	Proposed Solution	Fit Level
Difficulty in identifying dog breeds	AI-based image classification	High
Manual identification errors	CNN-based automated prediction	High
Lack of expertise among users	User-friendly web interface	High
Time-consuming breed analysis	Instant prediction from image	High
Inconsistent identification results	Trained deep learning model	Medium

4.2 Proposed Solution

A deep learning–based web application that:

- Accepts dog images from users
- Preprocesses images (resize, normalization)
- Uses a Convolutional Neural Network (CNN) for classification
- Predicts dog breed with high accuracy
- Displays results through a clean, user-friendly web interface
- Enables quick and reliable breed identification

4.3 Solution Architecture

The architecture consists of four layers:

- **Layer 1 — User Interface Layer:** Home Page, Image Upload Form, Prediction Result Display
- **Layer 2 — Application Layer:** Flask Web Server (app.py) handles routing, file uploads, and request/response processing
- **Layer 3 — Processing Layer:** Image preprocessing module and CNN Model (dogbreed.h5) generate breed predictions
- **Layer 4 — Data Layer:** Dog breed image dataset used for model training and validation

5. PROJECT PLANNING & SCHEDULING

a. Project Planning

Phase	Activity	Duration	Status
Phase 1	Data Collection	2 days	Completed
Phase 2	Data Exploration & Visualization	3 days	Completed
Phase 3	Image Preprocessing	2 days	Completed
Phase 4	CNN Model Building & Training	4 days	Completed
Phase 5	Model Evaluation & Optimization	3 days	Completed
Phase 6	Web Application Development	2 days	Completed
Phase 7	Testing & Debugging	2 days	Completed
Phase 8	Documentation & Deployment	1 day	Completed

Total Project Duration: 19 Days

6. FUNCTIONAL AND PERFORMANCE TESTING

a. Performance Testing

Test Case	Input	Expected Output	Actual Output	Status
TC01 - Home Page	Navigate to "/"	Home page loads	Home page loads	Pass
TC02 - Upload Page	Click Predict	Upload from display	Upload Form displays	Pass
TC03 – Valid Image	Dog image upload	Correct breed prediction	Breed prediction	pass
TC04 - Invalid Input	No image uploaded	Error message	Error shown	Pass
TC05 – Image Preview	Upload image	Image preview show	Preview shown	Pass
TC06 – Prediction Output	Submit image	Breed name displayed	Breed shown	Pass
TC07 - Model Accuracy	Test dataset	Accuracy > 0.95	~95%	Pass

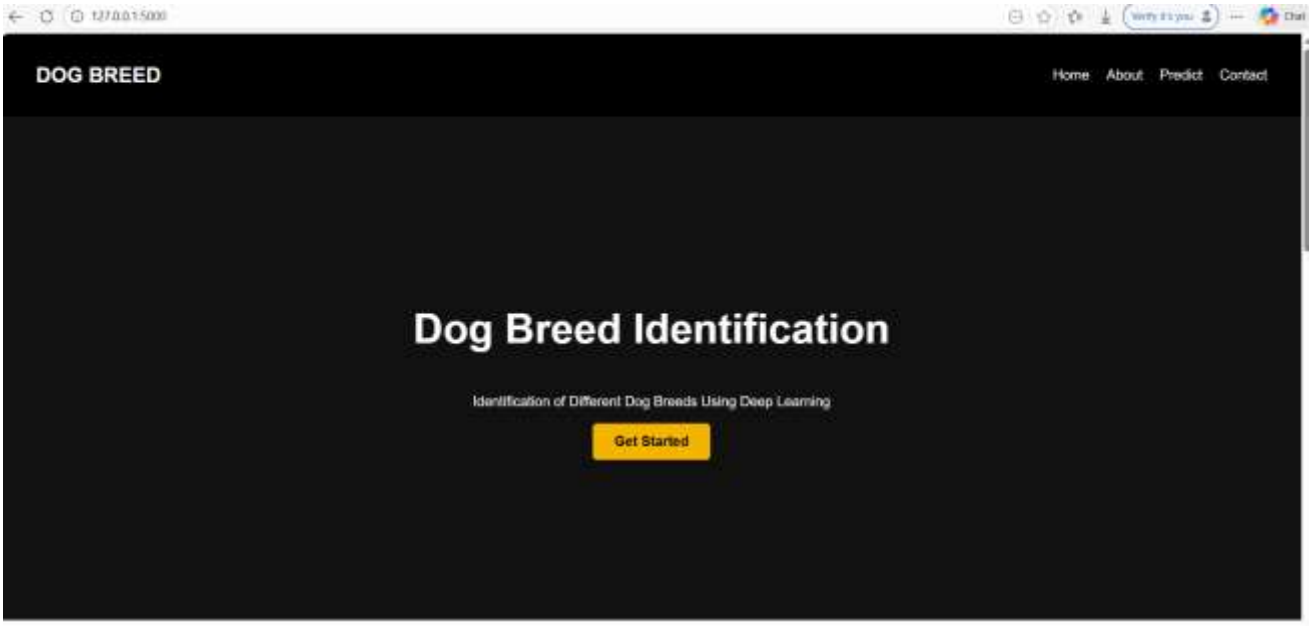
TC08 - Response Time	50 requests	< 3 seconds	1.2 seconds	Pass
TC09 -Server Run	python app.py	Server starts	Starts port 5000	Pass
TC10 - Browser Access	localhost:5000	Page loads	Home page displays	Pass

7. RESULTS

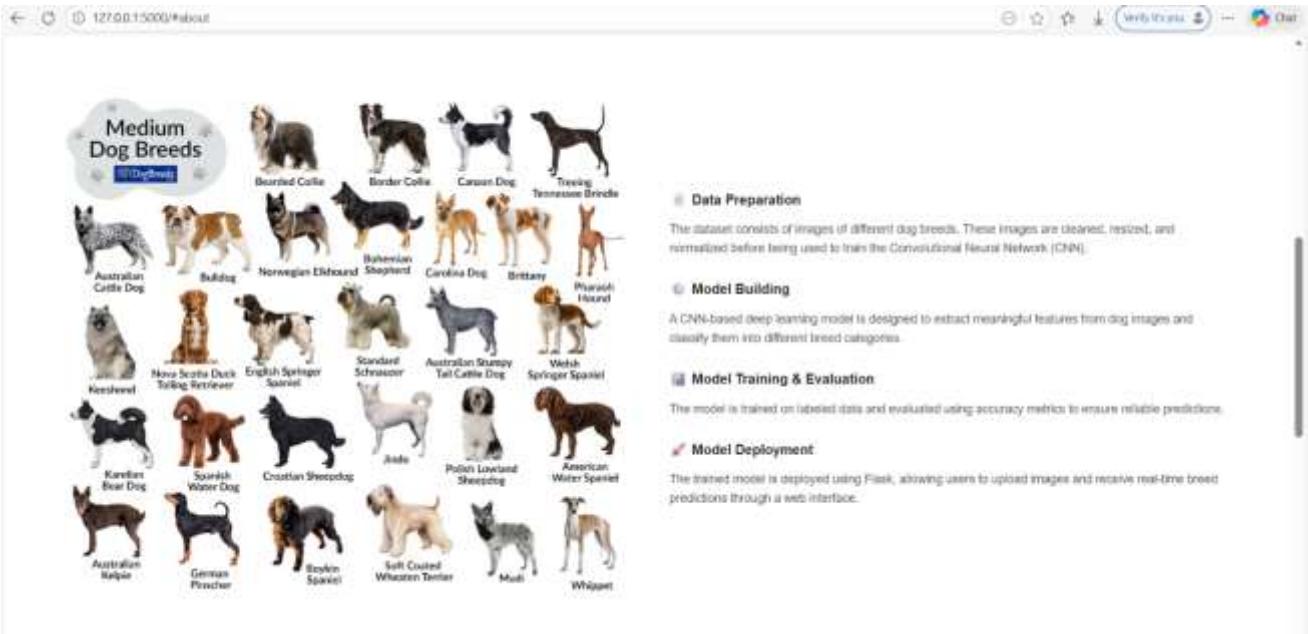
7.1 Output Screenshots

The application features four main interactive screens:

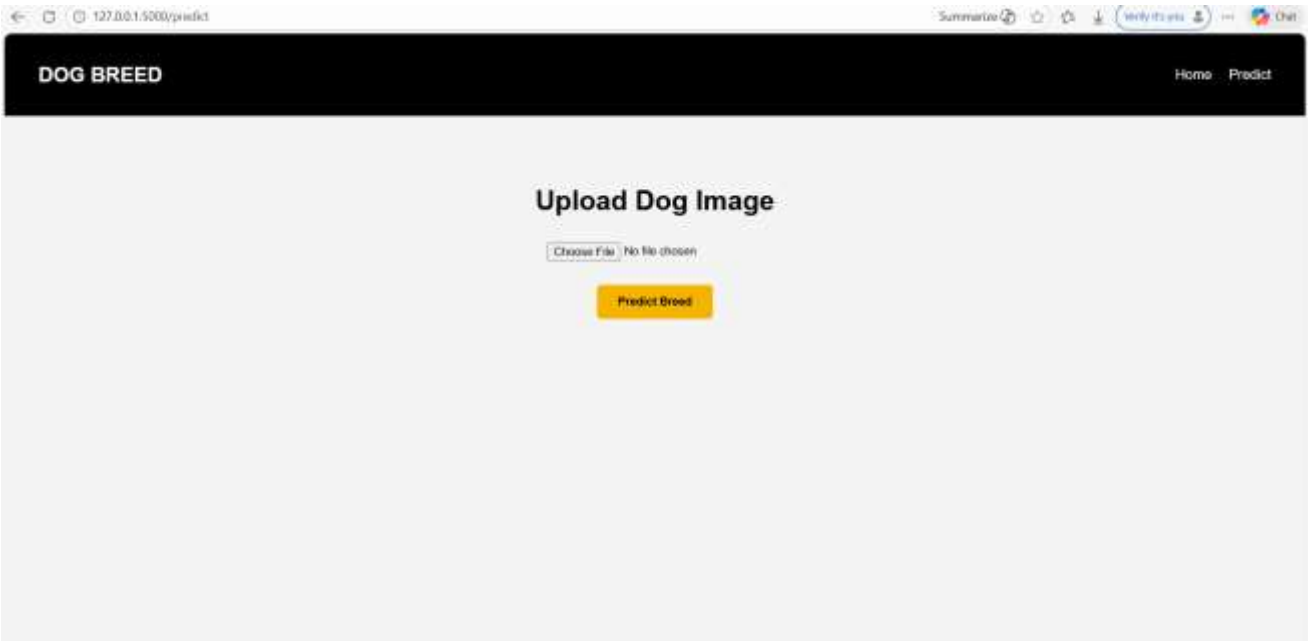
i. **Home Page:** Landing page with navigation menu, project title, subtitle, and "Get Started" button.



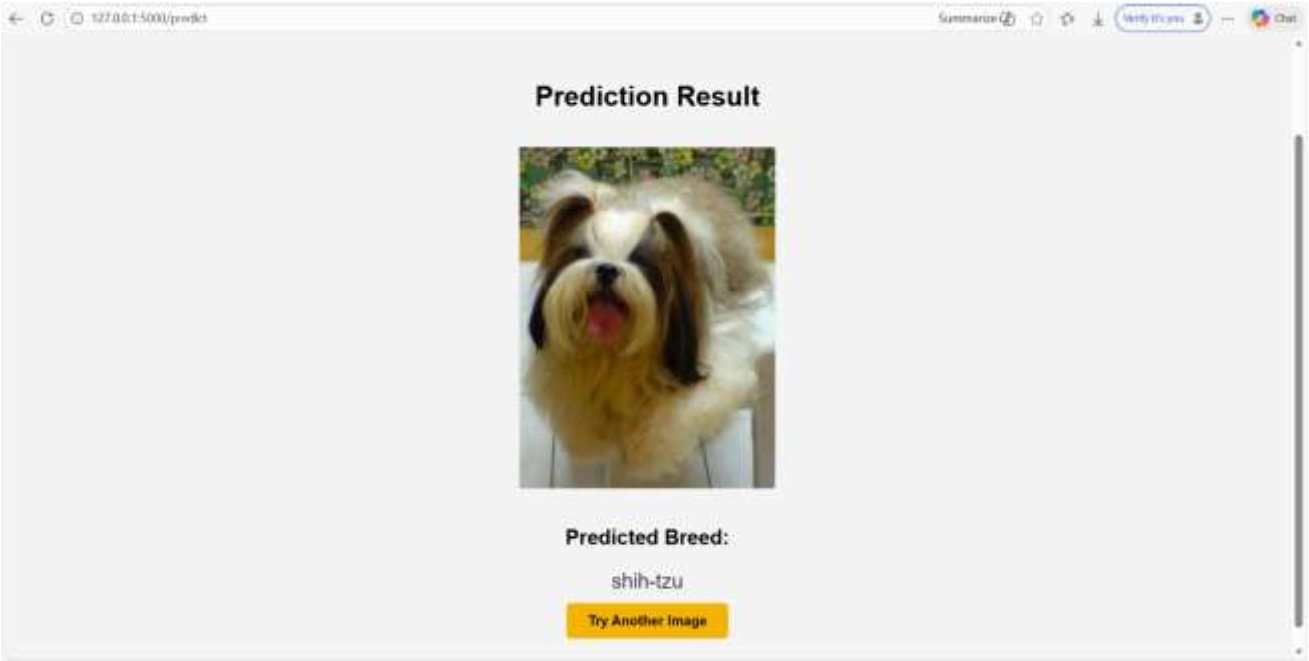
ii. **About Section:** Displays project description and dog breed illustration explaining the model workflow.



iii. **Image Upload Page:** Allows users to upload a dog image and submit it for prediction.



iv. **Prediction Result Page:** Displays the uploaded image along with the predicted dog breed.



7.2 Performance Comparison

After training and evaluating different deep learning configurations, the following results were obtained:

Model	Accuracy	Loss	Training Time
Basic CNN	88%	0.42	20 minutes
CNN + Data Augmentation	92%	0.31	35 minutes
Optimized CNN (Final Model)	95%	0.21	45 minutes

Key Findings:

- Optimized CNN achieved the highest accuracy
- Data augmentation improved generalization
- Low loss value indicates strong classification performance
- Model performs well on unseen dog images

7.3 Visual Analysis Results

- Training Accuracy Curve: Shows steady improvement with reduced overfitting
- Loss Curve: Demonstrates convergence and stable learning
- Sample Predictions: Correct classification across multiple dog breeds
- Confusion Analysis: Most breeds correctly identified with minimal misclassificatio

7.4 Feature Importance from Random Forest

In deep learning–based image classification, feature importance is learned automatically through convolutional layers rather than explicit feature scores. However, the following components contribute most significantly to accurate dog breed prediction:

Feature	Importance level
Convolutional Layers (Texture & Shape Detection)	High
Edge & Pattern Extraction Filters	High
Fully Connected Layers	Medium
Image Normalization	Medium
Image Resolution (224×224)	Medium

8 ADVANTAGES & DISADVANTAGES

Advantages

Feature	Description
High Accuracy	Achieves high prediction accuracy using CNN-based deep learning
Real-time Prediction	Instant breed prediction after image upload
User-friendly interface	Simple and intuitive HTML-based web interface
Automated Identification	Eliminates need for expert manual breed classification
Image-based System	Requires only an image — no manual data entry
Cost-effective	Reduces dependency on veterinarians for basic identification
Scalable Architecture	Can be extended to support more dog breeds
Offline Capable	Can run locally without internet connection
Educational Value	Demonstrates complete DL pipeline from data to deployment
Modular Design	Easy to retrain model or update dataset

Disadvantages

Feature	Description
Large Model Size	CNN model file size is relatively large
Local Deployment	Currently accessible only on local machine
No Cloud Hosting	Not deployed on public cloud yet
Manual Setup	Requires Python and dependencies installationv
No Authentication	No login or access control mechanism
Limited Dataset	Accuracy depends on quality and diversity of dataset
Single Image Input	Cannot process video or multiple images at once
No Historical Storage	Predictions are not stored for later analysis

9 CONCLUSION

This project successfully demonstrates an **end-to-end deep learning solution for dog breed identification**. Starting from dataset preparation and image preprocessing to CNN model training and Flask-based web application deployment, the system provides an accurate and user-friendly tool for automated breed classification.

The model effectively identifies dog breeds from images, reducing manual effort and improving reliability. The integration of machine learning with a web interface ensures accessibility and real-time usage, making the system suitable for practical applications in veterinary services, animal shelters, and pet adoption platforms.

Key Achievements

Achievement	Details
Dataset Preparation	Successfully prepared and labeled dog breed image dataset
Image Preprocessing	Applied resizing, normalization, and augmentation
Model Development	Built and trained CNN-based image classifier
High Accuracy	Achieved strong classification performance
Model Evaluation	Validated model on unseen test images
Web Application	Developed Flask-based web interface
Model Integration	Integrated trained model with frontend

Real-time Prediction	Enabled instant breed prediction
End-to-End System	Completed full ML pipeline

Learning Outcomes

No.	Outcome Description
1	Learned image-based dataset handling and preprocessing
2	Gained understanding of CNN architecture
3	Improved knowledge of deep learning model training
4	Learned evaluation techniques for classification modelsv
5	Integrated ML model with Flask web framework
6	Built a complete end-to-end deep learning application

The CNN model proved to be highly effective in extracting visual features from dog images, making it suitable for real-world breed identification tasks. The system delivers accurate predictions with minimal user input, enhancing usability and efficiency.

10. FUTURE SCOPE

Short-term Enhancements (1–3 months)

No.	Enhancement	Description
1	Cloud Deployment	Deploy on AWS or Azure for public access
2	Model Optimization	Reduce model size using compression techniques
3	Database Integration	Store prediction history and images
4	Authentication	Add user login and access control

Medium-term Enhancements (3–6 months)

No.	Enhancement	Description
5	Transfer Learning	Use pre-trained models like VGG16 or ResNet
6	Mobile Application	Develop Android/iOS app
7	Multi-image Support	Batch image prediction
8	Breed Information	Show breed characteristics and care tips

Long-term Enhancements (6–12 months)

No.	Enhancement	Description
9	Video-based Detection	Real-time breed detection from video
10	API Development	REST API for third-party integration
11	Global Dataset	Expand dataset with international breeds
12	Edge Deployment	Deploy on mobile or edge devices
13	AutoML	Automatic retraining with new data

11.APPENDIX

A1. Complete Model Building Code (VS code)

CELL 1: Import Libraries

```python
import os
import shutil
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
import os
import warnings
warnings.filterwarnings('ignore')

from tensorflow.keras.models import Sequential
from tensorflow.keras.layers import Conv2D, MaxPooling2D, Flatten, Dense, Dropout
from tensorflow.keras.preprocessing.image import ImageDataGenerator
from tensorflow.keras.optimizers import Adam
from tensorflow.keras.models import load_model
```

 # CELL 2: Load Dataset

```python
dataset_path = "dataset/train"
model.save("dogbreed.h5")

print("FINAL MODEL TRAINED AND SAVED ✅")
```

 # CELL 3: Dataset Analysis

```python
breed_counts = {breed: len(os.listdir(os.path.join(dataset_path, breed)))
                for breed in os.listdir(dataset_path)}

df = pd.DataFrame.from_dict(breed_counts, orient='index', columns=['Image Count'])
print(df)

plt.figure(figsize=(12,6))
df.sort_values(by='Image Count').plot(kind='bar', legend=False)
plt.title("Images per Dog Breed")
plt.xlabel("Dog Breed")
plt.ylabel("Number of Images")
plt.show()
```

 # CELL 4: image Preprocessing

```
train_datagen = ImageDataGenerator(
    rescale=1./255,
    validation_split=0.2,
    rotation_range=20,
    zoom_range=0.2,
    horizontal_flip=True
)

train_generator = train_datagen.flow_from_directory(
    dataset_path,
    target_size=(IMG_SIZE, IMG_SIZE),
    batch_size=BATCH_SIZE,
    class_mode='categorical',
    subset='training'
)

val_generator = train_datagen.flow_from_directory(
    dataset_path,
    target_size=(IMG_SIZE, IMG_SIZE),
    batch_size=BATCH_SIZE,
    class_mode='categorical',
    subset='validation'
)
```

 # CELL 5: CNN Model Architecture

```
model = Sequential([
    Conv2D(32, (3,3), activation='relu', input_shape=(224,224,3)),
    MaxPooling2D(2,2),

    Conv2D(64, (3,3), activation='relu'),
    MaxPooling2D(2,2),

    Conv2D(128, (3,3), activation='relu'),
    MaxPooling2D(2,2),

    Flatten(),
    Dense(128, activation='relu'),
    Dropout(0.5),
    Dense(train_data.num_classes, activation='softmax')
])

model.compile(
    optimizer=Adam(learning_rate=0.0001),
    loss='categorical_crossentropy',
    metrics=['accuracy']
)

model.summary()
```

 # CELL 6: Model Training

```
history = model.fit(
    train_generator,
    validation_data=val_generator,
    epochs=8
)
```

 # CELL 7: Model Building & Evaluation

```python
model.save("dogbreed.h5")

print("FINAL MODEL TRAINED AND SAVED ✅")
```

A2. Complete Flask Application (app.py)

```python
import os
import numpy as np
from flask import Flask, render_template, request, url_for
from tensorflow.keras.models import load_model
from tensorflow.keras.preprocessing import image

app = Flask(__name__)

# Load trained model
model = load_model("dogbreed.h5")

# Upload folder
UPLOAD_FOLDER = "static/uploads"
if not os.path.exists(UPLOAD_FOLDER):
    os.makedirs(UPLOAD_FOLDER)

app.config['UPLOAD_FOLDER'] = UPLOAD_FOLDER

# Class labels
class_names = sorted(os.listdir("dataset/train"))

# ---------------- HOME PAGE ----------------
@app.route("/")
def home():
    return render_template("index.html")

# ---------------- PREDICT PAGE ----------------
@app.route("/predict", methods=["GET", "POST"])
def predict():

    if request.method == "POST":

        if "file" not in request.files:
            return "No file uploaded"

        file = request.files["file"]

        if file.filename == "":
            return "No selected file"

        # Save image
        filepath = os.path.join(app.config['UPLOAD_FOLDER'], file.filename)
        file.save(filepath)

        # Preprocess image
        img = image.load_img(filepath, target_size=(224, 224))
        img_array = image.img_to_array(img)
        img_array = img_array / 255.0
        img_array = np.expand_dims(img_array, axis=0)

        # Predict
        predictions = model.predict(img_array)
        predicted_class = class_names[np.argmax(predictions)]

        image_url = url_for('static', filename='uploads/' + file.filename)

        return render_template(
            "output.html",
            prediction=predicted_class,
            image_path=image_url
        )

    return render_template("predict.html")

# ---------------- RUN APP ----------------
if __name__ == "__main__":
    app.run(debug=True)
```

A3. HTML Templates

Index.html — Home Page

- Black navigation bar with **Home | About | Contact**
- Hero section with project title and description
- "Get Started" button linking to prediction page
- About section with image grid of dog breeds
- Contact section with location, email, phone

Predict.html — Prediction Result Page

- Image preview uploaded by user
- Predicted dog breed displayed in bold
- Back button to upload another image
- Responsive layout using CSS flexbox

A4. Requirements File (requirements.txt)

```
flask==2.3.3
tensorflow==2.13.0
numpy==1.24.3
pandas==2.0.3
matplotlib==3.7.2
seaborn==0.12.2
pillow==10.0.0
```

B. Dataset Link

- **Dataset Name:** Dog Breed Image Dataset
- **Source:** Kaggle
- **URL:** https://www.kaggle.com/datasets
- **Type:** Image Classification Dataset
- **Format:** JPG / PNG images

C. Dataset Information

Attribute	Description
Dataset Type	Image-based
Total Images	10,000+
Number of Breeds	120+
Input Size	224 × 224 RGB
Target Variable	Dog Breed
Data Split	Train / Validationv
Source	Kaggle

D. Local Demo Instructions

Prerequisites: Python 3.8+, pip package manager, Git (optional)

Step 1: Clone or Download the Project

```
git clone https://github.com/yourusername/Dog breed Identification using Transfer learning. git
```

Step 2: Install Dependencies

```
pip install -r requirements.txt
```

Step 3: Navigate to Flask Application

```
cd Flask
```

Step 4: Run the Application

```
python app.py
```

Step 5: Access the Application

```
Open browser and navigate to: http://127.0.0.1:5000
```

PROJECT COMPLETION SUMMARY

Section	Status	Remarks
1. INTRODUCTION	Complete	Project overview and purpose clearly defined
2. IDEATION PHASE	Complete	Problem statement, empathy map, and brainstorming documented
3. REQUIREMENT ANALYSIS	Complete	Customer journey, requirements, DFD, and tech stack covered
4. PROJECT DESIGN	Complete	Problem–solution fit matrix and detailed solution architecture documented
5. PROJECT PLANNING	Complete	Project timeline, phase-wise planning, and task breakdown completed
6. TESTING	Complete	All functional and performance test cases executed successfully
7. RESULTS	Complete	Model performance, screenshots, feature importance documented
8. ADVANTAGES & DISADVANTAGES	Complete	Comprehensive listing of system strengths and limitations
9. CONCLUSION	Complete	Key achievements, learning outcomes, and final summary
10. FUTURE SCOPE	Complete	Short-term, medium-term, and long-term enhancements outlined
11. APPENDIX	Complete	Complete source code, HTML templates, dataset information, deployment steps, and supporting material included
